

The designer has an idea and wants to draw their concept

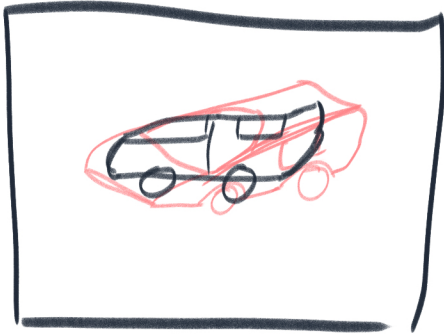

They begin to draw their idea out, as a rough sketch to communicate their concept

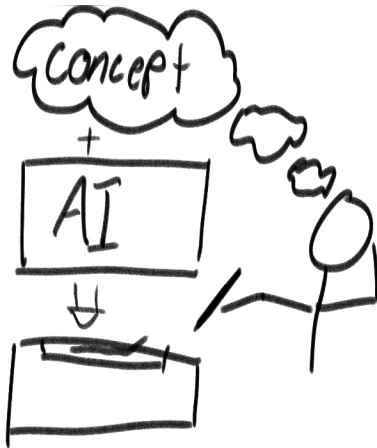

Upon reflection, their initial sketch holds little resemblance to their mental model

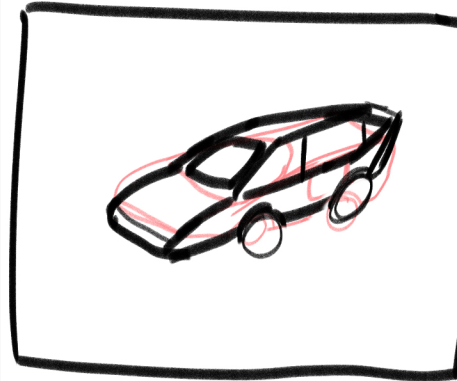

The designer adds descriptive text to their Design and asks AI to provide some assistance

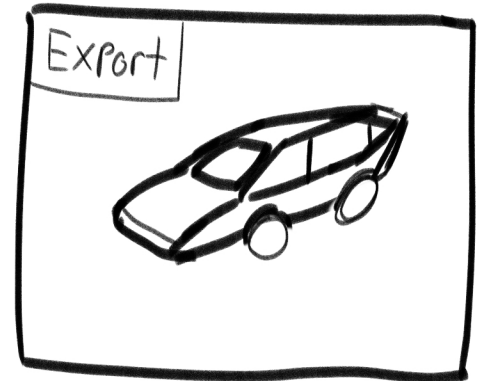

The AI provides a reference layer underneath the working layer of the designer

The designer can now compare their concept with the AI suggestion for their drawing

The designer can make changes to their current sketch based on the AI reference layer

Once the designer is ready to export, it will only produce what they have drawn
